EDUCATION

National University of Singapore **Aug 2026 – May 2030 (Expected)**

Bachelor of Computing (Honours) in Computer Science *Singapore*

- Awarded the Stephen Riady Young Entrepreneur Scholars (SRYES) Scholarship

Temasek Polytechnic **Apr 2021 – May 2024**

Diploma in Information Technology with Merit *GPA: 3.99*

- Lee Kuan Yew Award for Mathematics and Science; AWS Singapore Course Gold Medal; IMDA Excellence Award

EXPERIENCE

GovTech Singapore **Apr 2023 – Apr 2024**

Software Engineer Intern *Singapore*

- Independently built the CCUBE Admin Portal to configure Listing Layer services, replacing manual Postman requests and direct SQL and configuration-file edits with a developer-facing interface.
- Implemented a Monaco-based configuration editor with IntelliSense and type checking to **catch malformed service JSON before changes are applied**.
- Partnered with UX designers and internal users to turn a large configuration form into focused workflows, adding validation and confirmations that **clarified the impact of risky changes** before submission.
- Built admin endpoints, fixed bugs and improved shared utilities across Citizen Cluster services, and enhanced form booking flows in Resource Booking System 2.0.
- **Technologies:** Next.js, Koa, TypeScript, TypeORM, PostgreSQL, Docker, AWS, Jira, Figma

PROJECTS

Transito **May 2021 – Present**

Cross-Platform Bus Timing App | Website *Flutter, TypeScript*

- Built and maintain Transito, a Flutter bus timing app for Singapore commuters, launching it on Android in 2022 and iOS in 2024; grew adoption to **750+ monthly and 500+ weekly active users**.
- Designed the home screen around the immediate need to check the next bus, bringing favourite and nearby stops directly into view without unnecessary clutter. Kept the experience fast and focused, with the information commuters need available as soon as they open the app.
- Unified NUS shuttles and public buses through a shared stop model and consistent interface, letting commuters check campus and public services in one place. Hosted a Koa/TypeScript backend on Google Cloud that caches and reshapes LTA DataMall data, so search and nearby stops load faster.

Canvas-to-Notion Workflow **Aug 2026 – Present**

Automated Academic Task Manager | GitHub *AI Agents, Notion, MCP*

- Automated Canvas LMS updates into a Notion study planner that gives every unfinished task one clear place, without manually reconciling the two systems; scheduled a Codex agent to update the planner only when course data changes.
- Built a read-only **Canvas MCP integration** for assistant plugins. Chose Notion for its existing MCP support, letting users add tasks and query their workload conversationally through ChatGPT and Claude.
- Packaged onboarding as an **agent-led setup interview**, so users can give an agent the repository and personalise course selection, sync schedules and Notion configuration through guided questions, with answers checked before settings are saved.
- Kept users in control of automated changes: deletions require manual approval, missing dates are flagged for review instead of guessed, course content is treated as untrusted input, and failed or unverified updates are retried from the last successful sync.

Andrea **Sep 2026**

AI Small Claims Assistant, SMU LIT Legal-Tech Hackathon 2026 | GitHub *React, TypeScript, AI Agents*

- Built a web app and AI agent backend as a team of law and computing students, guiding people without a lawyer through Small Claims Tribunal claims from an eligibility check to filing and hearing day.
- Designed the agent to test a claimant's story rather than agree with it, surfacing follow-up questions as a questionnaire with editable suggested answers so they **confirm facts in their own words**.
- Engineered a custom agent harness whose typed, revision-checked tools are the model's only way to edit a case, keeping the user's account, document evidence and AI inferences separate so guesses never pass as fact.
- Compiled cue cards and every piece of evidence into a court-day pack of Typst PDFs from a revision-bound snapshot, so the agent cannot promise a file that does not exist; exposed the workflow to ChatGPT via MCP.

Native Glass Navbar **Dec 2025 – Present**

Open Source Flutter Package | GitHub *Dart, Swift*

- Created an open-source Flutter plugin that brings native iOS 26 Liquid Glass navigation to Flutter apps, earning **65+ GitHub stars** and **2,300+ monthly downloads** on pub.dev.
- Embedded UIKit's `UITabBar` through platform views and method channels to preserve the system's animations and behaviour, with a Dart API for SF Symbols, theming and action buttons, plus dark mode support and fallback widgets for older iOS versions and other platforms.

CO-CURRICULAR ACTIVITIES

Clynk **Nov 2023 – May 2024**

Co-Founder & Product Lead

- Led a five-person team building an NFC business card with customisable digital profiles that users could switch between for networking, portfolios and events.
- Piloted the working prototype at Temasek Polytechnic Open House 2024, supporting 200+ visitor interactions.

SKILLS

- **Languages:** TypeScript, JavaScript, Dart, Swift, Python, Java, SQL
- **Frontend & Mobile:** React, Next.js, Flutter, SwiftUI, Tailwind CSS
- **Backend, Cloud & Tools:** Node.js, Koa, PostgreSQL, TypeORM, Firebase, AWS, Google Cloud, Docker, Git
- **AI Tooling:** Claude Code, Codex, Model Context Protocol (MCP), Playwright
